

Create a node/express (MVC) web application that creates Orders for an eCommerce flow. Your application should consist of Orders, Users, Inventory tables. You need not implement cart functionality or other tables.

Please create functional APIs for the following

1. An API to create order (make sure all proper checks and validation are in place)

Please note the following things:

1. Every user can order the same item multiple times as long as the inventory exists.
2. Make sure you handle race conditions wherever necessary
3. Choose an appropriate database for the flow (NoSQL or SQL and explain the reason for the choice)

Your answer will be judged on the **validation, comments, data modeling, scenarios handled**. Include as many minute details in the business logic. Your expertise in structuring the code and handling all cases related to a feature is what will be looked at.
